

# Technical Lighting Control

## New TLC product

### 17659 1" ball with 1/4"-20" threaded hole:

This newly introduced TLC 1" diameter ball with its 1/4"-20 threaded hole will bridge the gap between a regular tripod screw and our TLC line of strobe adapters and arm components.

One popular use for this 1" ball is to mount it on a compact tripod and then attach a slaved strobe using our regular TLC component. This gives a photographer more creative freedom with its lighting techniques, Strobe with snoot attachment will be able to attain and maintain, the critically precise and independent positioning necessary when using this method.

In cave and wreck diving, multiple slaved strobes on mini tripod can add another artistic dimension by being able to be hidden behind objects or structures, all the while, retaining the flexibility to position the angle of light where the photographer wants it directed.

Check the Technical Lighting Control section of our website for other useful lighting solutions.
